
PLASTIC SURGERY GROUP London

Breast Augmentation using silicone implants

A silicone implant is placed either under the mammary gland or partially under the pectoral muscle. We use different types of implants for breast augmentation, individually tailored to your requests or needs. In general, we place the skin incision in the lower breast crease. In selected cases, an implant can also be inserted via an incision in the areola (coloured area surrounding the nipple).

QUESTIONS YOU MAY WANT TO ASK DURING THE CONSULTATION:

- DO I NEED TO CHANGE THE IMPLANTS AT ANY TIME?
- CAN I HAVE A NORMAL SCREENING EXAM WITH THE IMPLANTS?
- ARE THE SCARS VISIBLE?

INFORMATION ABOUT THE PROCEDURE:

Duration of case: 1 hour

General Anaesthesia required

Post-operative recovery approximately 14 days

No physical activity/sport for approximately 6 weeks
